We report on the observation of strong coupling between a microcavity mode and single quantum dots using a pair of bimodal microcavities. The bimodal microcavities are formed by the interference of two modes in a microcavity, which can be well tuned with the interference fringe period. When the coupling strength of the microcavities is large, the single quantum dots in the two microcavities couple with each other and form a shared resonator state. Thus, quantum dot emission lines can be electromagnetically coupled to the bimodal microcavity mode to generate the energy splitting in the same way as for a single quantum dot. The same energy splitting has been observed in both photoluminescence spectra and electrical conductance spectra, which provides a direct evidence for the strong coupling between the microcavities and single quantum dots.Q: Will it be better if I use schema as 'user' instead of 'login'? I have used login as schema to store the related tables. Now I wonder will it be better if I use user as schema instead of login? I am new to MySQL and I am working with it as a hobby. A: It depends on your particular use-case. If your queries can be expected to be about users, then they'll work better as user. If your queries can be expected to be about logins, then they'll work better as login. In most cases, login is a good name for the schema because it helps prevent renaming the schema at a later date and forgetting to change the name of the table it refers to. Q: Regular
