## What's New in the?

Portable aMule is a free and easy-to-use program for file transfers over p2p networks. Out-of-box web-based registration for all files will allow you to pick a good default file name, quickly connect to peers with a click of a button, start downloading files, and get to work. The main advantage of this file transfer application is its design, which allows for a clear and intuitive interface. That said, without the ability to add or manage peers, aMule's interface is quite barebones. While basic tools are pretty basic, there is still a lot of configuration options that can be tweaked for even the most demanding client. Most of these options are in the connection preferences window that you get to via the settings button. Let us take a look at some of the most important settings: Choose a default peer The "Peer Last Seen" section allows you to set a default peer for each client. If there are no already set peers when you start, you can choose a default peer you'd like to use. Moreover, you can set more than one default peer for each client. Use proxy Proxy is important if you need to secure your peer-to-peer connection, but it is important to make sure that you have appropriate permissions set. You can also use a proxy in case you don't want to clutter your computer's interface with unwanted peer requests. Buffer size One of the most crucial settings for any file transfer client is buffer size. It determines the amount of data that will be transferred by a peer. If you are setting this to 100MB, only 100MB of data will be downloaded at once by all connected peers. If you set this to 500MB, however, 500MB of data will be downloaded at a time by all connected peers, with the rest being downloaded in chunks (read more on this below). Choosing a lower buffer size will help you when transferring files with great sizes, but may hurt you when you are transferring small files, as the connection will become slower. To find out what works best for you, you have to start up aMule and send a file of about 50MB and see if it is being downloaded in bursts or smoothly. Make a mule Simply put, this mode speeds up your aMule by letting it connect to multiple peers simultaneously. Drop rate You can set your drop rate at various intervals, with the upper limit of 4000 drops a second. It
